Active-Active

Understanding Active-Active

- Key Concerns
 - DML conflicts when the subscribed data conflicts with data already present in the relation.
 - The "echo effect" where data, initially propagated from the published table, returns to its original source host server as a DML operation.
- Mitigation Techniques
 - Maintaining consistent table definitions i.e. table columns and their constraints between PUBLISHED and SUBSCRIBED tables.
 - Filtering undesired rows when creating the PUBLICATION using the WHERE clause
 - Setting the ORIGIN parameter to "none" at SUBSCRIPTION creation.

Active-Active: 2 Node example Step 1: Create Environment

```
-- common to both primary nodes
create role active_active with login replication password 'active';
create database db01;
```

Active-Active: 2 Node example Step 1 cont'd

```
pg1
\c db01
drop table if exists t1;
create table t1(
     id uuid default gen random uuid()
    ,comments text default 'pg1'
    ,t stamp timestamptz default clock timestamp()
    ,PRIMARY KEY (t stamp,id)
grant all on all tables in schema public to active active;
```

```
pg2
\c db01
drop table if exists t1;
create table t1(
     id uuid default gen random uuid()
    ,comments text default 'pg2'
    ,t stamp timestamptz default clock timestamp()
    ,PRIMARY KEY (t stamp,id)
grant all on all tables in schema public to active active;
```

Active-Active: 2 Node example Step 2: Start Replication

```
-- PUBLICATION

-- pg1
create publication pg1 for table t1;

-- pg2
create publication pg2 for table t1;
```

```
-- SUBSCRIPTION

-- pg1
create subscription pg1
    connection 'host=pg2 port=5432 dbname=db01
    user=active_active password=active'
    publication pg2
    with (origin=none, copy_data=false);

-- pg2
create subscription pg2
    connection 'host=pg1 port=5432 dbname=db01
    user=active_active password=active'
    publication pg1
    with (origin=none, copy_data=true);
```

Active-Active: 2 Node example Step 3: Validation

```
insert into t1 values
   (default, default),
   (default, default),
   (default, default);

-- pg2
insert into t1 values
   (default, default),
   (default, default),
   (default, default),
   (default, default),
   (default, default);
```

Active-Active: Caveat

- In order that logical replication can function all tuples (records) must be unique in a table i.e. possess a PRIMARY, or UNIQUE, key..
- Where primary or unique keys do not exist in a table, the SQL command ALTER TABLE ... REPLICA IDENTITY
 ... can add the necessary information to the WAL making logical replication possible.

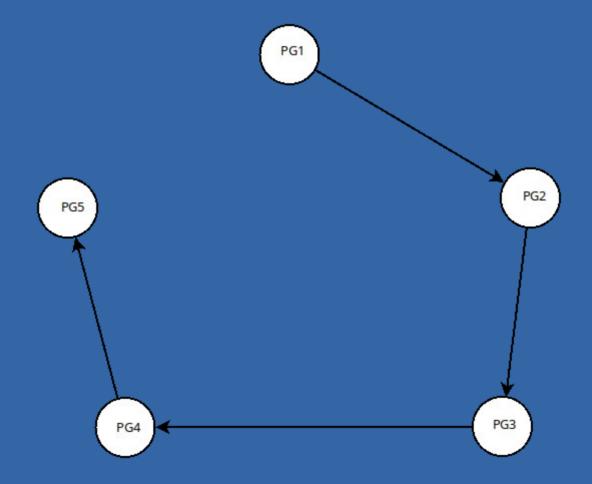

Architectural Types

Architectural Types

- Daisy Chain
- Star
- Mesh

Daisy Chain (1 way-replication)

Daisy Chain Step 1: Create Table and Publication

```
for u in 1 2 3 4 5
do
    echo "======= pq$u ======="
    psql -q "host=pg$u dbname=db01 user=postgres password=postgres" << eof</pre>
        drop publication if exists pg$u;
        drop table if exists t1;
        create table t1(
            id uuid default gen random uuid()
            ,comments text default 'pg$u-openai'
            ,t stamp timestamptz default clock timestamp()
            ,PRIMARY KEY (t stamp,id)
        grant all on all tables in schema public to active active;
        create publication pg$u for table t1;
eof
done
```

Daisy Chain Step 2: Create the Subscription

Daisy Chain Step 3: Insert Records

```
for u in 1 2 3 4 5

do
    echo "======= pg${u} ======="
    psql -q "host=pg${u} dbname=db01 user=postgres password=postgres" <<_eof_
        insert into t1 values
        (default, default),
        (default, default);
    eof_
        sleep 1s

done</pre>
```

Daisy Chain Step 4: Query Records

```
for u in 1 2 3 4 5
do
    echo "======= pg${u} ======="
    psql -q "host=pg${u} dbname=db01 user=postgres password=postgres" <<_eof_
        select * from t1 order by 3;
eof_
done</pre>
```

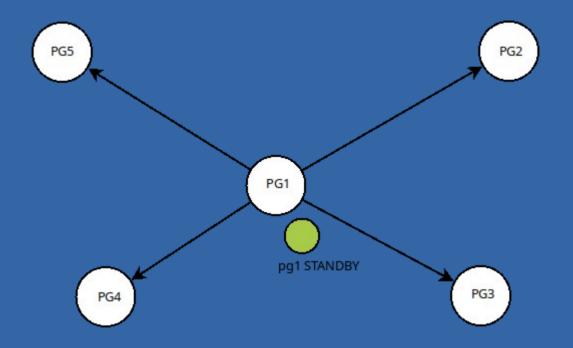

Daisy Chain Step 4 cont'd:

- Advantages ?
- Disadvantages?

Star Topology (1 way-replication)

Star Topology Step 1: Create Table and Publication on Primary

```
psql "host=pgl dbname=db0l user=postgres password=postgres" << _eof_
    drop publication if exists pgl;
    drop table if exists t1;
    create table t1(
        id uuid default gen_random_uuid()
            ,comments text default 'pgl-openai'
            ,t_stamp timestamptz default clock_timestamp()
            ,PRIMARY KEY (t_stamp,id)
    );
    create publication pgl for table t1;
    grant all on all tables in schema public to active_active;
eof_</pre>
```

Star Topology Step 1 cont'd: Create Table on REPLICA(s)

```
psql "host=pgl dbname=db01 user=postgres password=postgres" <<_eof_
    drop publication if exists pgl;
    drop table if exists t1;
    create table t1(
        id uuid default gen_random_uuid()
            ,comments text default 'pgl-openai'
            ,t_stamp timestamptz default clock_timestamp()
            ,PRIMARY KEY (t_stamp,id)
    );
    eof_</pre>
```

Star Topology Step 2: Create Subscription

Star Topology step 2 cont'd:

```
WARNING: publication "pg2" does not exist on the publisher
NOTICE: created replication slot "pg2" on publisher
====== pa2 ======
subname | subenabled |
                                                 subconninfo

```

Mesh

- Advantages: Not only can multiple DML operations be executed on each host but one can failover to any one of the PRIMARY read-write nodes without downtime or SUBSCRIPTION configuration updates.
- Disadvantages: Topology complexity and network overhead increases as the system scales.
